

Project Applicant

Lorenz Gruber, Simon Ittensammer, Simon Zweimüller

Initial situation

- There are already surveillance systems, which stream their videos to an interface
- People need to take their medicine while watching television

Problems

- These systems leave little room for personalization
- It is quite tricky to stream different videos from different cameras to the same interface
- People often forget about important things, like taking their medicine, while watching television

Tasks

- Create an interface, which lets the user easily switch between different videos
- Let the user add additional videos to the interface
- Let the user create personalized messages, which are displayed in the video
- Let the user schedule a personalized message, which is going to be shown on TV

Usefulness

- Users need less time to configure their surveillance systems
- People are reminded about important things, if it is taking medicine it could even be life saving
